[Abstract] **Objective** Through a systematic literature search, we collected, organized and analyzed the existing method for preparing animal models of functional dyspepsia and commonly used assays to improve model research method. **Methods** The search terms “functional dyspepsia, animal model” and “functional dyspepsia, animal model” were search CNKI, WanFang, VIP and SinoMed, PubMed, Web of Science, Cochrane Library, and Embase databases, and the search time was from the establishment of the database to June 21, 2022. **Results** A total of 71 articles were included, including 63 articles in Chinese and 8 articles in English. The subjects of the study were all rats, with male and female selection, and the age ranged from 1 day to 84 days. There were 32 modeling method, including 7 single-factor modeling and 25 multi-factor modeling. Modeling cycles ranged from 6 to 98 days. Test indicators covered the general situation, gastrointestinal function and mental state and other major aspects. **Conclusions** (1) For animal models of functional dyspepsia, male SD rats of 6~8 months old are mainly used for modeling, and the modeling method are mainly single-factor tail-clamping stimulation and multi-factor irregular diet+tail-clamping stimulation. The most selected detection indicators are gastric emptying/residual rate, general conditions of the experimental animals and small intestinal propulsion ratio,

功能性消化不良(functional dyspepsia, FD)是一种以胃和十二指肠功能障碍为特点的非器质性疾病,症状表现为上腹痛综合征(epigastric pain syndrome, EPS)和餐后窘迫综合征(postprandial distress syndrome, PDS)两种类型。近年来,新冠病毒的流行加重了公众焦虑抑郁的情绪,导致罹患FD的人群增多,原有FD症状加重^[1],演变为不可忽视的公共卫生问题,国内外学者对FD发病机制和治疗方法的研究也随之增加。目前,FD的治疗方法包括幽门螺杆菌根除^[2]、质子泵抑制剂^[3]和促胃动力药^[4]等,艾灸^[5]、针刺^[6]和心理干预^[7]等补充替代疗法也起到一定作用,但FD的一线治疗方案仍以药物干预为主^[8]。作为研究FD的重要手段,稳定而可靠的FD动物模型是开展相关研究的关键和基础,但目前模型动物的品系和造模方式尚未有统一标准^[9]。因此,本研究对已有的FD动物实验文献进行收集、整理和分析,通过探讨动物种类、造模方式及主要检测指标的选择依据,旨在提供科学且可重复的FD动物模型制备方法。

1 资料与方法

1.1 数据来源

以“功能性消化不良”和“动物模型”为主题,在中国知网、万方、维普和中国生物医学数据库进行检索;以“functional dyspepsia”“non-ulcer dyspepsia”“epigastric pain syndrome”“postprandial distress syndrome”“models, animal”“laboratory animal model”“animal model”“experimental animal model”为关键词,在PubMed、Web of Science、Cochrane Library、Embase数据库进行检索。检索时间为建库至2022年6月21日,共检索到期刊文献311篇。

1.2 文献筛选标准

(1)纳入标准:研究功能性消化不良并造模成功的动物实验文献;(2)排除标准:学位论文、会议和综述;资料不全的文献。最终纳入符合标准的文献71篇,文献检索流程见图1。

1.3 统计学分析

实验动物名称、种类等均按照《实验动物和动物实验技术》进行规范,将收集的实验动物种类、造

模方式、造模周期、检测指标等录入Excel 2019建立数据库,对纳入文献的研究结果采用频数和百分比进行统计描述,对数据进行整理、统计和分析。

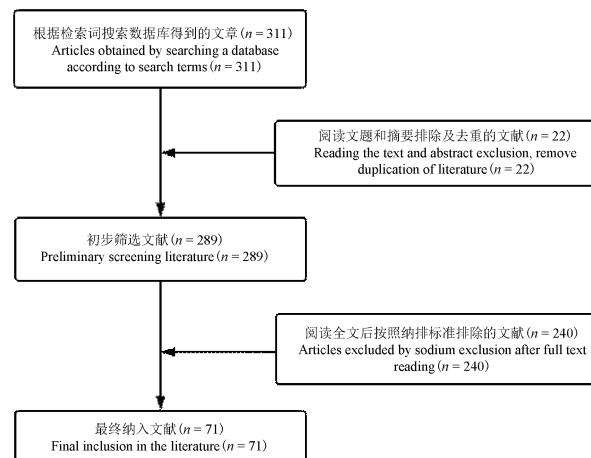

图1 文献检索流程图

2 结果

2.1 实验动物选择

71篇文献涉及的造模动物种类均为鼠类,共有3种品系,包括SD大鼠(40次,56.34%)、Wistar大鼠(27次,38.03%)和KM小鼠(4次,5.63%),具体见表1。动物性别主要选择雄性(34次,47.89%),雌雄各半(25次,35.21%),具体见表2。动物年龄多选用6~8月龄(12次,16.90%),但有33篇文献未对实验动物年龄进行描述(33次,46.48%),具体见表3。

表1 FD模型动物种类及频次

Table 1 Species and frequency of functional dyspepsia model animals

种类 Strain	频数(次) Frequency(Times)	频数/总数(%) Frequency/Total(%)
Sprague Dawley 大鼠 Sprague Dawley rats	40	56.34
Wistar 大鼠 Wistar rats	27	38.03
KM 小鼠 KM mice	4	5.63
合计 Total	71	100.00

表 2 FD 模型动物性别及频次

Table 2 Sex and frequency of functional dyspepsia

性别 Sex	model animals	
	频数(次) Frequency(Times)	频数/总数(%) Frequency/Total(%)
雄性 Male	34	47.89
雌性 Female	3	4.23
雌雄各半 Half male and half female	25	35.21
雌雄兼用 Both male and female	4	5.63
未提及 Not mentioned	5	7.04
合计 Total	71	100.00

表 3 FD 模型动物年龄及频次

70 ~ 84 d	2	2.82
84 d	2	2.82
未提及 Not mentioned	33	46.48
合计 Total	71	100.00

2.2 造模方式

71 篇文献共有 32 种造模方式, 其中单因素造模方式 7 种, 使用最多的为夹尾刺激法(19 次, 26.76%); 多因素造模方式 25 种, 使用最多的为不规则饮食+夹尾刺激法(11 次, 15.49%)(见表 4)。

2.3 造模周期

71 篇文献共存在 17 种造模时间, 其中以 7 d 为周期进行造模最多(18 次, 25.35%), 其次为 14 d(15 次, 21.13%) 和 21 d(8 次, 11.27%)(见表 5)。

2.4 检测指标

71 篇文献共涉及 102 种检测指标, 累计频数 346 次, 其中胃排空/残留率检测最多(41 次, 11.56%), 其次为一般情况(40 次, 11.56%), 排名第三为小肠推进比(28 次, 8.09%), 具体见表 6。

3 讨论

目前 FD 的发病机制尚未明确, 越来越多的研究表明, FD 可能是多种致病因素共同作用而产生, 包括心理疾病^[10]、幽门螺旋杆菌感染^[2]、十二指肠嗜酸性粒细胞增多^[11]、不良饮食习惯^[12]和肠-脑相互作用障碍(disorders of gut-brain interaction, DGBI)^[13]等, 因此, 在造模方式的选择中应当有针对性的选择干预因素和造模周期, 并根据造模方式的特点选择合适的动物品系、性别和生长阶段, 检测指标应根据 FD 的症状表现和具体研究目的进行选择。

3.1 造模动物属性

3.1.1 动物种类

文献挖掘结果表明, 目前 FD 造模选取的动物品种以大鼠为主, 其中 SD 大鼠和 Wistar 大鼠为主要选择品系, 也有 4 篇文献^[14-17]选取 KM 小鼠进行造模。选择鼠类的原因在于其饲养成本低, 易于繁殖且生长速度快。与 SD 大鼠相比, Wistar 大鼠更易受应激因素影响^[18], 干预效果更明显。但 SD 大鼠生长发育较 Wistar 更快, 且对性激素敏感程度高。

3.1.2 动物年龄

71 篇文献共包含 16 种不同的年龄阶段, 从出生后 1 d 的新生大鼠到 12 周的成年大鼠均有。其中, 选择出生后 7 d 的幼鼠及 6 ~ 8 周的成年大鼠进行研究最为频繁。研究发现, 早期生活事件会导致大鼠成年后产生抑郁行为^[19], 而选择幼鼠进行早期母婴分离也会导致成年后抑郁状态。同时, 不同年龄阶段的动物胃肠敏感性不同, 在大鼠幼年时期进行干预更易导致成年后的 FD 症状。而选择成年大鼠则更贴近 FD 患者的真实胃肠状态。

3.1.3 动物性别

造模动物多选择雄性为主, 也有部分文献选择雌雄各半或雌性兼用。研究表明, 在人类群体中相比于男性, 女性更易产生 FD 症状^[20], 而动物实验发现雌性动物更易受精神因素的影响^[21-22], 这可能是由于焦虑、抑郁情绪通过影响下丘脑-垂体-肾上腺轴(hypothalamic-pituitary-adrenal axis, HPA) 中激素

和脑肠肽的正常水平,从而导致胃肠功能障碍。因此,选择雌性动物进行造模更可能产生阳性结果。

3.2 造模方式及周期

对全部文献中 32 种造模方式进行整理后分析,可分为单因素刺激和多因素刺激两类造模方式:单因素刺激包括物理因素刺激、化学因素刺激、慢性不可预知性刺激和早期生活事件共 4 种,多因素刺激则为以上 4 种因素中选取 2 种或 3 种联用。其中,共有 27 篇文献选择单因素造模法,44 篇文献采用多因素复合造模法。通过不同指标检测均判定为造模成功。

单因素造模方式中夹尾刺激^[23~40]选择最多,主要通过夹尾后产生的应激反应,导致 HPA 兴奋增高,并出现焦虑抑郁情况。目前,研究者多复制郭海军等^[41]的夹尾刺激法进行造模,即用海绵钳夹住大鼠尾巴远端 1/3 处,每次 30 min,每日 4 次,持续 1 周。但也有学者发现,短期高频率的应激刺激会导致大鼠胃黏膜发生器质性改变,可以减少每日刺激频率,延长造模周期来进行模型改良^[42]。碘乙酰胺 (iodoacetamide, IA) 蔗糖混合液灌胃^[43~45]也是常用的单因素造模方式,选取幼年大鼠进行灌胃,利用 IA 将胃肠组织蛋白烷基化的特性^[46],使胃肠内壁受刺激产生炎症反应导致内脏高敏感,影响其正常发育,成年后大鼠均发生不同程度的胃肠功能障碍。但碘乙酰胺作为烷基化试剂,会对动物的胃肠黏膜造成损伤,并导致内壁产生不同程度水肿,易造成实验动物死亡,实验中需要对造模参数进行精确把控,现多采用 0.1% 的 IA 与 2.0% 的蔗糖混合后进行灌胃^[47],结果表明实验组大鼠胃敏感度增高,顺应性降低,成年后胃肠功能多有不同程度障碍。需要注意的是,采用单因素刺激造模持续时间短,往往不能代表 FD 患者的真实情况;此外,选用单一造模因素可能会导致实验动物耐受度增强,不利于进行长期实验,影响模型的成功制备。

多因素造模方式中,不规则饮食+夹尾刺激^[48~58],不规则饮食+稀盐酸^[15,59~62]和碘乙酰胺蔗糖混合液+小平台站立^[63~65]选择较多。不规则饮食通过模拟饮食失调,使大鼠处于饥饱失常状态,与夹尾刺激联用更符合 FD 的病理机制,成模效果优于单纯夹尾刺激。稀盐酸可抑制胃肠蠕动,延缓胃排空水平^[66]。与碘乙酰胺类似,采用稀盐酸造模易对大鼠造成器质性损害,现多在水中加入 10 mol/L 稀盐酸 10 mL^[59,67]稀释后供大鼠自由饮用,通过破

坏大鼠胃肠的酸碱平衡,产生内脏高敏感状态,与不规则饮食联用从饮食失调和内脏高敏模拟 FD 患者的日常情况。小平台站立同样会使大鼠产生应激反应,同时为了防止从小平台跌落入水,大鼠需始终保持清醒状态,在应激的基础上造成过度倦怠,产生焦虑抑郁情绪。也有学者采用慢性不可预见性刺激进行造模^[68~69],需要注意的是干预因素增多并不会增加造模成功的概率。相反,采取的刺激方式越多,造模难度越大,造模过程中需要控制的变量越多。对于模型成功的评价,是某单一因素产生作用还是多种联合产生作用难以做出明确的推断。

综上所述,单因素造模法简单易行、成模较快,但维持时间短、动物易产生耐受性,且只能从单一角度模拟 FD 患者的发病机制,而多因素复合造模更贴近 FD 患者发病的真实情况。干预因素的选择尚无统一标准,具体选择何种刺激因素联合使用仍需更多的实验予以证明。

3.3 检测指标

文献挖掘的结果表明,大鼠的一般情况如毛发色泽、活动度、大便性状、体重等为检测最多的外在指标,可通过肉眼观测直接获得。造模成功的大鼠多表现为毛色枯黄不顺、活动度降低、大便稀溏秽臭、体重减轻。但此类指标尚无统一的衡量标准,主要依据研究者的个人经验予以判断。不可否认的是,大鼠的一般情况仍是最直接且便于获取的观测指标,研究者可基于此对实验动物的成模情况进行初步评价。

胃排空^[17]、残留率^[70]和小肠推进比为检测最多的胃肠道指标,将胃肠运动功能进行量化后观测,判断成模的效果。具体的操作方式是将自制的营养性半固体糊中加入少量碳末混合后进行灌胃,然后取胃肠进行检测。造模成功的大鼠表现为胃排空延缓、小肠推进比降低。也有学者认为,灌胃产生的刺激会对大鼠精神状态产生不同程度的影响,改变胃排空状态^[71],而计算 3 h 自由摄食量^[72]可以更好地模拟日常饮食状态,并且减少灌胃不当造成的意外死亡。另外,由于 FD 无器质性病变的病理特点,取胃肠组织进行形态学检查,观察有无溃疡炎症等病理学改变,从病理机制上证明造模是否成功。

由于 FD 症状的特殊性,患者负性的情绪变化常与胃肠道症状伴随出现^[73],因此对实验动物心理

状况的检测也同样重要。目前,糖水消耗实验^[58]和旷场实验^[74]常用于检测大鼠焦虑抑郁情况,造模成功的大鼠糖水消耗量减少,水平活动范围缩小,垂直站立次数减少。另外,进食能量的减少同样可以表明大鼠情绪状况的改变。但是,单纯出现焦虑抑郁的情况并不能表明造模成功,应结合胃肠道功能检测进行判断。

胃排空延迟、胃顺应性降低和内脏高敏感是 FD 的主要病理机制^[75],实验动物的一般情况和情绪负性变化也是不可忽视的症状表现。另外根据不同的研究目的,采用透射电镜观测胃肠 Cajal 细胞和 Cx43 间质细胞^[28]结构变化的细胞学检查,采用 ELISA 试剂盒检测血液中 MTL^[51]、GAS^[76] 和 CCK^[77] 等胃肠激素含量的血清学检查,采用 Western Blot 检测胃肠组织中相关蛋白表达^[29,49-50]的分子生物学检查,以及采用 RT-PCR 检测相关 mRNA 表达^[51,78] 的基因学检查也有所选择。由于 FD 发病机制的复杂性,症状涵盖消化、神经等多个系统的多维性,单一指标的检测结果并不能作为造模成功的标准。因此,应选择对应的指标进行检测,胃肠功能、精神心理状态和病理形态是选择检测指标的 3 个主要范围。

3.4 FD 动物模型的发展与展望

依据发表时间对纳入文献进行整理后发现,早期的研究者多倾向于单因素造模方式,如夹尾刺激;随着 FD 可能的发病机制和肠脑轴概念的提出,FD 模型的制备方式也随之改变,由单因素造模法逐步转变为多因素复合造模法,由单纯的物理刺激转变为多系统与多维度的复合刺激来模拟 FD 的产生。随着时间的推移,检测指标的选择也愈发广泛。研究者的目光不再局限于实验动物的外在表现和胃肠动力学指标,血清学检查、细胞学检查和分子生物学检查逐渐增多,蛋白组学、细胞组学和基因组学的研究方法也被更多学者采用,这表明对 FD 的研究方向正从器官水平向细胞和分子水平不断深入,造模成功的评判标准也更具有可信度。综上所述,对 FD 动物模型的研究仍处于不断更新与完善的过程中,但仍存在以下问题:①缺少统一且量化的造模因素与相应的造模周期;②检测指标多依据研究者的经验和研究目的进行选择,缺少统一的模型评判标准;③应结合西医病情与中医症状的特点,制作“病症结合”的动物模型,完善模型的完整性。
